Spacoust

Hear the planet.

An app that turns Earth and space images into music anyone can understand, including people who cannot see them.

The Earth Information Jukebox challenge

Designed, built and tested by one developer

Earth data speaks only to the eyes

2.2 billion

people live with a near or distance vision impairment

Source: World Health Organization, fact sheet, February 2026

Maps are built to be looked at

Satellite images and climate maps carry their meaning in colour and shape.

Legends take training

Reading ozone in Dobson units or ocean heat from a colour bar takes practice.

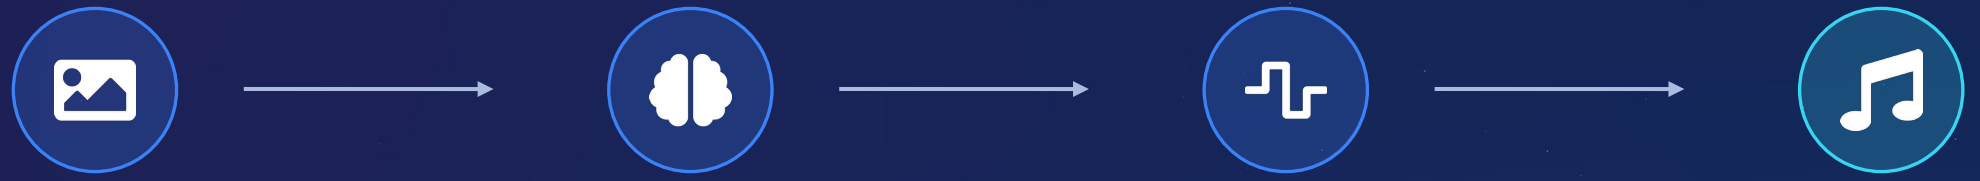

Change is hard to feel

An ozone hole or a warming ocean feels distant on a chart.

What if you could listen to the planet instead?

Spacoust lets you hear any image

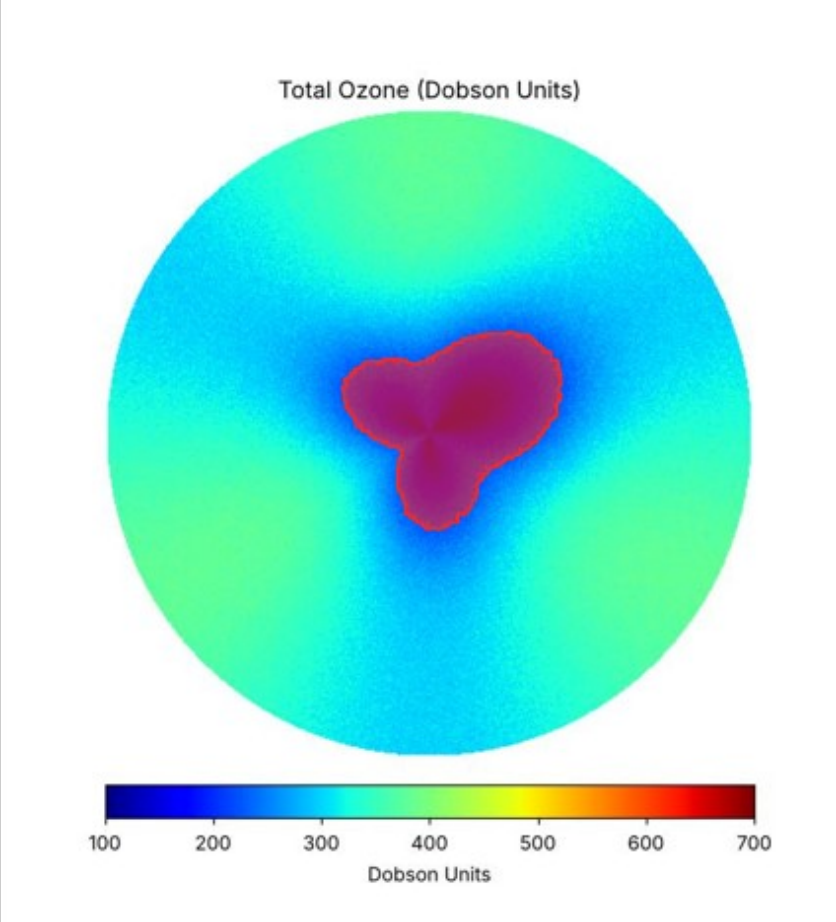

Open an image → **AI reads it** → **Pixels become values** → **You hear it, with a spoken guide**

Brightness **Pitch**	Darkness **Silence**	Main colour **Musical scale**
Edges **Rhythm**	Red vs blue **Left or right**	Over a scientific limit **Clashing notes**

Same image, same music, every time. Every note comes from the data; nothing is random.

It reads scientific maps, not just colours

Ozone hole found and outlined in red (test map with known values)

Spacoust finds the colour legend, turns every pixel into a real value and checks it against a scientific limit. Areas over the limit play clashing notes, ring a fixed alert and turn red.

Map	Limit	What it means
Ozone	**below 220 DU**	Ozone hole (standard definition)
Sea surface temperature	**26.5 °C or more**	Warm enough to fuel hurricanes
Land surface temperature	**45 °C or more**	Extreme heat
Temperature anomaly	**+2 °C or more**	Much hotter than normal

Tested on maps with known answers: ozone hole measured 7.5%, true value 7.1%.

From the stars to live earthquakes

Planets

Mars sounds dusty; Saturn rings like bells

Nebulae

Slow, wide pads; glowing gas plays higher

Galaxies

Sound circles left and right like spiral arms

Earth photos

Hurricanes, wildfires and sea ice get their own signals

Live USGS earthquakes: louder = stronger, low note = deep, left = west. A whole week becomes about a minute of sound. (Map: test run.)

Observations of what already happened, never forecasts.

Built for everyone, built to be trusted

Accessible

- Spoken guide in English or Arabic before each piece
- Fixed sound signals: two bells always mean an ozone hole
- Fully usable from the keyboard

Trustworthy

- Checks if an image is real or AI-generated
- Uses evidence inside the file, not only looks
- Labels doubtful findings as illustrations

Tested

- Ozone hole: 7.5% measured, 7.1% true
- Hurricane-warm water: 27% measured, 24% true
- 60+ antivirus engines: clean

Install now

Built from start to finish by one developer

Sound engine, scientific map reader, AI analysis, narrator, live earthquakes, authenticity check, desktop app and website.

Free for Windows 10 and 11.
